Thank you for purchasing a YANMAR Marine Diesel Engine.

[INTRODUCTION]

- This Operation Manual describes the operation, maintenance and inspection of the YANMAR marine diesel engine.
- Read this Operation Manual carefully before operating the engine to ensure that the engine is used correctly and that it stays in the best possible condition.
- Keep this Operation Manual in a convenient place for easy access.
- If this Operation Manual is lost or damaged, order a new one from your authorized YANMAR dealer or distributor.
- Make sure this manual is transferred to subsequent owners. This manual should be considered a permanent part of the engine and remain with it.
- Constant efforts are made to improve the quality and performance of YANMAR products, so some details included in this Operation Manual may differ slightly from your engine. If you have any questions about such differences, please contact your authorized YANMAR dealer or distributor.
- The specifications and components (instrument panel, fuel tank, etc) described in this manual may differ from the ones installed on your vessel. Please refer to the manual provided by the manufacturer of these components.

FOR YOUR SAFETY

Following the precautions described in this manual will enable you to use this engine with complete satisfaction. Failure to observe any of the rules and precautions, however, may result in injury, burns, fires and engine damage. Read this manual carefully and be sure you fully understand it before beginning operation.

Safety Symbols

These are the warning signs used in this manual and on the product.

This safety alert symbol appears with most safety statements. It means attention, become alert, your safety is involved! Please read and abide by the message that follows the safety alert symbol.

⚠️ DANGER

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

⚠️ NOTICE

NOTICE indicates a situation which can cause damage to the machine, personal property and/or the environment or cause the equipment to operate improperly.
Safety Precautions

Safety precautions for operation

⚠️ DANGER ⚠️

Burns from steam

- Never remove the filler cap from the coolant tank while the engine is still hot. Steam and hot air will spurt out and seriously burn you.
- After engine stop, wait until the water temperature drops. Wrap a cloth around the filler cap and slowly loosen the cap.
- After inspection, tighten the filler cap firmly.
  If the cap is not secure, steam or hot air can spurt out during operation and seriously burn you.

Ventilation of the battery area

- Make sure that the area around the battery is well-ventilated and that no flammable materials are near.
  The battery emits hydrogen gas during operation and charging. The gas can catch fire.

Fires from oil ignition

- Be sure to use the correct type of fuel oil. Always double-check before fueling.
  The wrong fuel oils (e.g. gasoline) can cause a fire.
- Be sure to stop the engine before fueling.
  If you spill fuel oil, wipe the spillage carefully.
- Keep oil and other inflammable materials away from the engine.
  They can catch fire.

⚠️ WARNING ⚠️

Exhaust gas poisoning

- Never cover or block the windows, air vents, fans or other ventilation devices in the engine room. Always maintain good ventilation in the engine room during operation.
  Breathing exhaust gas is dangerous to your health.

Moving parts

- Keep your hands, other body parts and clothing away from moving parts (e.g. the front drive shaft, V-belt or propeller shaft). You will get caught and injured.
- Never operate the engine without the covers on the moving parts.
- Before engine start, check that you removed all tools and cloths from the area near the engine.

Alcohol and drugs

- Never operate the engine while you are under the influence of alcohol or drugs. Never operate the engine when you feel ill or unwell.
CAUTION

Burns

- Be careful of burns. The entire engine is very hot during and after operation.
- Keep your hands, other body parts and clothing away from the exhaust manifold, exhaust pipes, turbocharger, air cooler and engine body.

Safety precautions for maintenance

DANGER

Burns from steam

- Never remove the filler cap from the coolant tank while the engine is still hot. Steam and hot air will spurt out and seriously burn you.
  After engine stop, wait until the water temperature drops. Wrap a cloth around the filler cap and slowly loosen the cap.
- After inspection, tighten the filler cap firmly.
  If the cap is not secure, steam or hot air can spurt out during operation and seriously burn you.

Fires from oil ignition

- Be sure to use the correct type of fuel oil. Always double-check before fueling.
  The wrong fuel oils (e.g. gasoline) can cause a fire.
- Be sure to stop the engine before fueling.
  If you spill fuel oil, wipe the spillage carefully.
- Keep oil and other inflammable materials away from the engine.
  They can catch fire.

WARNING

Fires from electric short-circuits

- Always turn off the battery switch or detach the earth cable (-) before you inspect the electrical system.
  If you cause a short-circuit, a fire can occur.

Moving parts

- Stop the engine before you inspect it. If you have no choice but to inspect the engine while it operates, keep your hands, other body parts and clothing away from rotating parts.
  You will get caught and injured.

Exhaust gas poisoning

- Never cover or block the windows, air vents, fans or other ventilation devices in the engine room. Always maintain good ventilation in the engine room during operation.
  Breathing exhaust gas is dangerous to your health.
WARNING
Side cover opening
• Do not open the side cover when the engine is hot. The new air intrusion may lead to an explosion.

CAUTION
Battery fluid
• Be very careful not to expose your skin or eyes to the battery electrolyte. The electrolyte is a strong acid and can cause inflammations. If you come in contact with the battery fluid, wash it off immediately with a lot of freshwater.

Burns
• Be careful of burns. The entire engine is very hot during and after operation.
• Keep your hands, other body parts and clothing away from the exhaust manifold, exhaust pipes, turbocharger, air cooler and engine body.

NOTICE
No modification
To keep the engine in good condition, the engine has been sealed to control the engine speed limit and the fuel injection quantity. If a seal is removed, the sliding and moving parts of the engine will suffer from increased wear. Engine performance will deteriorate and service life may shorten significantly. Removing a seal may also lead to increased lubricating oil and fuel consumption, seizure and breakage in all portions of the engine. Therefore, do not remove any seals. If the seal is removed, no warranty will be given even during the warranty period.

Regulation on NOx
Laws on maritime pollution and hazard prevention regulate the replacement of certain parts. The laws require that a record and the signature of personnel who replaces these parts is kept. All inspections and maintenance must be performed by our professional service technicians with the necessary expertise and skills.

Waste disposal
• Never dispose of waste oil, such as lubricating oil, by dumping it into a sewer, river, lake or ocean waters.
• Do not spill waste oil into ocean waters. Use a container to collect waste oil from the engine.
• Comply with relevant laws and/or regulations for the disposal of hazardous materials such lubricating oil, fuel, filters or batteries.
Warning Labels

For safe operation, the affixed position of the warning labels is indicated. Read the remarks of the warning labels carefully to attempt prevention of the accident. Also, if you need to replace a part that has a label affixed to it, make sure you order the new part and label at the same time.

If the warning labels are damaged or fallen, order them from your authorized YANMAR dealer or distributor.

Precautions for Lifting the Engine

The engine can cause serious injury when it falls during lifting. Obey the below instructions to prevent accidents during lifting.

⚠️ WARNING ⚠️

• Make sure that the engine is lifted by qualified persons.
• Before lifting, make sure that the engine lifting bracket and mounting bolt have no damage and are in good shape. If you find a fault, stop immediately and contact your authorized YANMAR dealer or distributor.
• Select lifting tools (e.g. wire rope and shackle) that are appropriate for heavy loads.
• Select the wire rope length so that the engine does not tilt during lifting.
• Before lifting, examine the lifting tools and make sure that they have no damage and are in good shape.
• Protect the parts of the engine or driven equipment that touch the wire rope with protective material.
• The tension of the wire rope changes depending on the lifting angle.
  Make sure that the angle is within 60°.
• If you use a marine gear that is not listed in this operation manual, separate the marine gear from the engine, and lift the marine gear and engine separately.
• During lifting and moving the engine, do not go under the engine or near the engine.

For the mass, refer to Specifications in the Operation Manual.
Engine Nameplates

Periodic inspection and maintenance are important to help you enjoy your engine. Your serial number is required at the time of requesting an engine maintenance or ordering a part. Confirm it beforehand.

■ Location of engine nameplate:
   The engine name plate is attached on the top of the exhaust manifold.

■ Location of marine gear nameplate (YX-50S: Option):
   The marine gear name plate is attached on the top of the marine gear case.

11 - Seawater pump
12 - Alternator
Fuel

The specification of fuel oil for this model is shown in the following table. The properties of fuel are uncertain and broadly ranged; thus they affect such factors as a smooth run of the engine, maintenance interval and service life of parts. Consequently, it might be necessary to change the specifications of engine or add attachment in accordance with the applied fuel oil.

- **Quality criteria of fuel oil**
  - The fuel cetane number should be 45 or higher.

<table>
<thead>
<tr>
<th>Quality criteria equivalent fuel oil</th>
<th>ASTM D975 2D, 1D</th>
</tr>
</thead>
<tbody>
<tr>
<td>BS-2869 Class A1 or A2</td>
<td></td>
</tr>
<tr>
<td>ISO 8217 DMX</td>
<td></td>
</tr>
<tr>
<td>EN 590</td>
<td></td>
</tr>
</tbody>
</table>

**NOTICE**

The fuel injection system consists of precision parts and for that reason, do not use fuel to which water and dust are mixed in. If such fuel is used, it causes a trouble. Consequently, pay attention to the following in supply of fuel. Besides, as for daily maintenance, carry out draining and maintenance servicing of fuel filter mentioned in Periodic Maintenance on page 31.

**In time of fuel supply**

- When supplying fuel stored in a drum, stand the drum still for longer than one whole day to settle the impurity, and supply supernatant liquid of the drum to this engine.
- In the case of supplying fuel from a storage tank to the service tank, supply such fuel after more than one whole day elapsed from when fuel is supplied to the storage tank.
Lubricating Oil

- Selection of lubricating oil is very important for a diesel engine. If improper lubricating oil is used or change of lubricating oil is neglected, it causes sticking of piston rings, seizure or early wear of pistons and cylinder liners and faster wear of bearings and various other moving parts that reduce the durability of the engine.
- Service categories
  Use an engine oil that meets or exceeds the following guidelines and classifications:
  - A.P.I. classification: Grade CD
  - SAE viscosity grade: 15W-40
  - T.B.N [mgKOH/g]: 9 - 15

<table>
<thead>
<tr>
<th>Application</th>
<th>Viscosity (SAE)</th>
<th>Specific gravity</th>
<th>Flash point (°C) (open type)</th>
<th>Pour point (°C)</th>
<th>Kinetic viscosity mm²/s (cSt) 40 °C</th>
<th>Kinetic viscosity mm²/s (cSt) 100 °C</th>
<th>Viscosity index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marine propulsion engine</td>
<td>15W-40</td>
<td>0.88</td>
<td>&gt; 230</td>
<td>&lt; -30</td>
<td>&gt; 100</td>
<td>14 - 15.5</td>
<td>&gt; 140</td>
</tr>
</tbody>
</table>

**NOTICE**

- Avoid blended use of different brands.
  (In the unavoidable case of blended use of different brands of lubricating oil, consult your lubricating oil supplier.)
- If lubricating oil of a high total base number (T.B.N.) is used when using fuel oil of a low sulfur content, additive (calcium carbonate) of lubricating oil sticks to the high-temperature area together with carbon residue and causes adverse effects as mentioned below. For that reason, use the proper lubricating oil.
  Accumulation of the aforementioned deposits on the combustion chamber hinders sliding of piston rings and may cause scuffing to the rings, cylinder liners, etc. Besides, they may cause bite-in and blow-by if intruded into exhaust valves.
Coolant

■ Coolant selection
Use clean coolant (tap water) for the coolant.
Use the water having the properties shown in the following table.

<table>
<thead>
<tr>
<th>Water quality for coolant</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>pH 298K (25 °C)</td>
<td>6.5 - 8.0</td>

</tr>
<tr>
<td>Evaporation residue</td>
<td>&lt; 400 ppm</td>
</tr>
</tbody>
</table>

■ Long life coolant (LLC) mixture selection
Always add Long Life Coolant (LLC) to the tap water. This mixtures serves as the coolant.
YANMAR recommends the following Long Life Coolant (LLC):
• TEXACO LONG LIFE COOLANT/standard and premixed
  Product Code 7997 and 7998
• HAVOLINE EXTENDED LIFE ANTIFREEZE/COOLANT
  Product Code 7994
or equivalent to the above LLC.

NOTICE
Choose LLC which will not have any adverse effects on the materials (cast iron, aluminum, copper, etc.) used in the engine’s cooling system, if different from the above.

Without this mixture, scale or rust is generated inside the parts of the coolant system, thus deteriorating cooling performance. In winter, never neglect to us LLC in order to prevent freezing.
If LLC use is neglected, the cooling water freezes and expands inside the engine, resulting in breakage of parts in the coolant system. The mixing ratio of LLC depends on the temperature. Be careful in using the mixing ratio specified by the manufacturer.

NOTICE
• Excess LLC deteriorates cooling performance.
  A thin mixture which does not provide protection sufficient for the lowest temperature will freeze and damage the cooling water system.
• Never mix different types (brands) of LLC, chemical reactions may make the LLC useless and engine trouble could result.
RUNNING-IN

When starting a new engine, perform the following procedure.

**Fuel**

1. Fuel filter
2. Orifice for air bleeding
3. Fuel priming pump
4. Fuel feed pump
5. Fuel filter/water separator
6. Fuel return line
7. Fuel tank
8. Fuel tank drain cock
9. 20 to 30 mm (0.8 to 1.2 in.) approximately
10. Fuel shutoff valve
11. Less than 500 mm (20 in.)
12. To fuel injection pump

- Check the piping between the fuel tank and the engine as illustrated above.
- Be sure to install a drain cock at the bottom of the fuel tank to remove drain, a fuel/water separator (filter) in the fuel piping.
- The fuel oil system has an automatic air bleeding device. In order to bleed the air, press down the fuel priming pump.
- Make sure the inside of the fuel tank and fuel lines have been thoroughly cleaned.
- Fill the fuel tank with fuel.

**DANGER**

- Use only diesel fuel. Never use other fuels, including gasoline, kerosene, etc., because they could cause a fire. Be sure to check that you have selected diesel fuel before filling the fuel tank.
- Be sure to stop the engine and confirm that there are no open flames in the vicinity before supplying fuel.
- If you spill fuel, wipe such spillage carefully.
Bleed the fuel oil system

If air enters the fuel system, the fuel injection pump does not work correctly. Bleed the fuel system and obey the following procedure when you fill fuel oil to the fuel tank for the first time, perform maintenance (such as replacing the fuel filter) of the fuel system, after the fuel oil has run out, and there is a failure at startup.

1. Check the fuel oil level in the fuel tank and open the fuel cock (or valve).
2. Loosen the air vent plug on the top of the fuel/water separator (option).
   When fuel oil without air bubbles comes out of the air vent plug hole, tighten the air vent plug.
3. Loosen the air vent plug on the top of the fuel filter.

4. Fill the fuel with the fuel priming pump.
   1- The knob on the top of the priming pump rises when you turn it counterclockwise.
   2- Repeat moving the knob up and down continuously by hand.
   Fuel oil with air bubbles comes out of the air vent plug hole of the fuel filter.

5. When fuel oil without air bubbles comes out of the air vent plug hole, tighten the air vent plug.
6. After you discharged air, screw the priming knob tight while pressing it down.
Lubricating Oil

As it is necessary to keep oil level correctly, obey following procedure when you fill the engine lubricating oil.

1. Remove the oil filler cap (1).
2. Fill recommended oil to the upper level mark on the dipstick (2) while checking the level with the dipstick (2).

| Oil capacity | 20 L (at upper level mark) |

3. Install the oil filler cap.

**NOTICE**

- Be sure to stop the engine before refilling.
- When checking the oil level, insert the dipstick fully.
- Do not overfill with oil, as this may cause oil to be sprayed out from the breather and damage the engine.

4. Fill the marine gear box with what the marine gear manufacturer recommended oil up to the proper level.
Cooling System (Seawater and Coolant)

1. Be sure to check the condition of tighten all the coolant drain cocks before filling coolant.
2. Fill the coolant tank with coolant up to the filler neck.
3. Fill the reservoir tank with coolant up to the upper level (FULL) mark.

<table>
<thead>
<tr>
<th>Coolant capacity</th>
<th>Engine</th>
<th>20 L</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Reservoir tank</td>
<td>1.5 L</td>
</tr>
</tbody>
</table>

**NOTICE**

- Always fill with clean coolant.
- Always use coolant mixed with LLC.

4. Tighten the filler cap securely.
5. Check to be sure that the joint of the overflow pipe between the reservoir tank and coolant tank are securely tightened.
6. Tighten the seawater drain cocks at the lubricating oil cooler and heat exchanger.
7. Tighten the side cover bolts of the seawater pump.

**Coolant passage**

- Cylinder block
- Heat exchanger
- Coolant filler cap
- Coolant reservoir tank
Seawater passage

- Lubricating oil cooler
- Heat exchanger
- Air cooler
- Seawater pump
Lubrication

Apply grease to the lubricating points on the ball joints of remote control cable (for the governor).

Remote Control Device (Option)

1. Operate the throttle handle from the position “L” to the (full) position “H” and check that the governor lever at the governor moves into correct position. Adjust the control cable if necessary.
2. Operate the shift handle into “AHEAD”, “NEUTRAL” and “ASTERN” and check that the marine gear control lever at the shift moves into correct positions. Adjust the control cable if necessary.

Cranking

Oil reaches all moving parts of the engine sufficiently, crank the engine according to the following procedure.

1. Set the shift handle into the “NEUTRAL” position.
2. Set the throttle handle into the “L” position.
3. Open the sea cock.
4. Turn the battery switch “ON”.
5. Start cranking.
   1- Put the key in the starter switch and turn it to the ON position.
   2- Pull the engine stop lever or press the “STOP” button of the instruments while turning the key to the START position to start the cranking.
   3- Cranking time is 5 seconds; check for abnormal sounds during that time.
      Release your hand after cranking.
Instruments Check before Starting

Turn the starter key to the “ON” position.
1. The needle of the oil pressure gauge should indicate “0”.
2. Make sure that the coolant temperature gauge operates properly.
3. The hourmeter should be working.
4. With the illumination switch ON, the illumination lamps of the LO. pressure gauge, the boost pressure gauge, the tachometer, and the coolant temperature gauge should all come on.

1 - Boost pressure gauge
2 - Engine lubricating oil pressure gauge
3 - Coolant temperature gauge
4 - Tachometer
5 - Buzzer switch
6 - Illumination switch
7 - Engine stop button (Keep pressing until engine stops.)
8 - Starter switch
9 - Buzzer
10 - Hourmeter
11 - Clock
12 - Alarm display

● Starter switch

1. Before starting
2. During operation
3. Starting
4. Release your hand after starting

● Stop button

● Buzzer

If one of the alarm lamps comes on, mentioned on the next page, the buzzer will sound intermittently. However, no buzzer will sound when the charge lamp and lubricating oil filter clogged alarm lamp comes on.

● Alarm lamps

When any failure occurs, the corresponding alarm lamp will come on.

● Buzzer stop switch

The switch is used to pause the buzzer sound. Do not turn off the buzzer stop switch unless you check for a failure.

● Illumination switch

The switch is used to illuminate the instrument panel.

● Tachometer

It shows the engine speed by min⁻¹ (rpm). The read value can be used as a guide for judging the load condition and the boat speed.
● Hourmeter
It shows accumulate operation time.
The read value can be used as a guide for periodic maintenance checks. The information is displayed in a window inside the tachometer.

● Engine lubricating oil pressure gauge
It shows the engine oil pressure by $10^{-1}$ MPa.
The red zone is caution and dangerous zone. The read value can be used as a guide for judging whether the engine is lubricated properly to prevent accidents.

● Coolant temperature gauge
It shows the coolant temperature by °C (centigrade).
The red zone is caution and dangerous zone of high temperature.
The read value can be used as a guide for judging whether the engine is cooling properly to prevent accidents.

● Boost pressure gauge
It shows the air pressure that flows to the combustion chamber by $10^{-1}$ MPa.
The read value can be used as a guide for judging whether the turbocharger is working properly to prevent accidents.

### Alarm devices

- **BATTERY CHARGE**
  Comes on if the charge is abnormal. The buzzer will not sound. Check for failures such as a slip or broken V-belt in the alternator.

- **COOLANT TEMPERATURE HIGH ALARM LAMP**
  Comes on if the coolant temperature becomes abnormally high. Continuous operation at temperatures exceeding the maximum will result in damage and seizure.
  Check the load and the water cooling system for any abnormalities.

- **LUBRICATING OIL PRESSURE LOW ALARM LAMP**
  Comes on if the engine lubricating oil pressure drops below the lower level. Continuous operation with insufficient oil will result in damage and seizure.
  Check the oil level.

- **COOLANT LEVEL LOW ALARM LAMP**
  Comes on if the coolant level drops below the lower level. Continuous operation at below the lower coolant level will rise the coolant temperature and will result in damage and seizure.
  Check the coolant level. In addition, check that there is no leakage from the cooling system.

- **CLUTCH OIL P.**

- **MARINE GEAR LUBRICATING OIL PRESSURE LOW ALARM LAMP**
  Comes on if the marine gear lubricating oil pressure drops below the limit level. Continuous operation with insufficient oil will result in damage and seizure.
  Check the marine gear lubricating oil level. It is useful if is coupled with YANMAR marine gear.

- **EXHAUST (COOLING SEAWATER FLOW) RESTRICTION**
  When the amount of cooling seawater being discharged is too low, the sensor will activate the warning indicator. Stop operation immediately to avoid damage to the engine.
  Check the seawater cooling system for restriction or damage.
Rechecking after Starting

When a new engine is operated for the first time, the oil level of the oil pan will drop due to the engine oil circulating to the oil cooler, oil filter, etc.

Therefore, stop the engine after operating for two to three minutes.

Wait for about five minutes and then check the following items:

• Check the engine oil level with the dipstick, and add oil up to the upper level if necessary.
• Check the marine gear oil level with the dipstick, and add oil up to the upper level if necessary.
• Check the coolant level of the coolant reservoir and the coolant tank.

Add coolant to the upper level if necessary.

⚠️ DANGER

Never remove the filler cap when the engine is hot (above 60 °C).

The coolant is under pressure and severe scalding could result.
Prior to starting the engine, check to see if there is nothing nearby the engine, particularly the rotating parts that may cause damage.

**Starting**

1. Move the shift handle to the neutral position “N”.
2. Move the throttle handle to the position “L”.
   - Before starting engine
     1. Turn ON the battery switch.
     2. Put the key in the starter switch.
        - Turn the key from the OFF to ON position and check that alarm devices are shown in the table “Normal function of alarm devices” on page 25 are working properly.
        - The buzzer sounds briefly (for approx. 1 second).
        - The battery charge lamp should sequentially-lighted; other alarm lamps should lighted and off after approx. 3 seconds.
3. Turn it to the “START” position. Once the engine starts, release your hand from the key. Then it will return to the “ON” position automatically. With the key in the “ON” position, the power source of the instruments and warning devices is engaged.

**NOTICE**

- If the engine did not start, do not continue cranking for longer than 15 seconds at any one attempt. Allow at least 30 seconds of rest between attempts. This will permit the battery to recover, and prevent to overheat the starter.
- When restarting, turn the starter switch after stopping the engine completely.
  If the starter switch is turned on before the engine comes to a complete stop, serious damage to the starting motor pinion and ring gear of flywheel may result.
4. Checking the alarm devices just after starting engine
   - Turn the key from the START to ON position and check that alarm devices are shown in the table below "Normal function of alarm devices" are working properly.
   - The buzzer stops.
   - All alarm lamps go off.

By performing these procedures, it can be determined whether or not the electric circuit of the buzzer and alarm lamps is in good working order. If there is any problem, consult your authorized YANMAR dealer or distributor for investigation and repair.

Cold start (option)

Air heater operation
1. When starting during cold condition, first turn the starter switch to GLOW (for a few moments) to activate the heater.
2. Next, after 20 - 30 seconds turn the starter switch to START. When the engine starts, the microcomputer catches the engine revolution and activates the after-heater which remains on for 3 minutes.
3. The heater will operate for a maximum of 1 minute before the after-heat mechanism is activated. During this period if the engine does not start, the after-heater will not be activated. Start the engine within 1 minute after turning the key to "GLOW".
4. When starting under normal conditions, the "GLOW" position is not used, and the heating mechanism is not activated.

Procedure
1. Put the shift handle in "N".
2. Put the throttle handle at low idle position.
3. Turn the starter switch key to "GLOW" (for a moment).
4. After 30 seconds, turn the key to “START”, and the engine starts.
5. Release your hand from the key after starting; the key will return automatically to “ON”.

Notice after starting
- With the shift handle in the neutral position, observe the following instructions after starting.
  - After starting, set the engine speed to 600 min⁻¹ (600 rpm).
  - Make sure that seawater is coming out from the cooling water (seawater) outlet.
  - Check that the battery charge warning lamp (CHARGE) turns off consequently.
  - Make sure that the coolant temperature gauge, on the instrument panel, reads 40 °C or more.

**NOTICE**

Do not turn off the key in the starter switch and the battery switch in the “OFF” position when operating the engine.
Notice while Running with Load

While running the engine, pay attention to the following.
If problem occurs during operation, try to find the cause. If the cause cannot be found and the vessel is able to continue operation, return to port at a low speed. Consult your nearest authorized YANMAR dealer or distributor after return.

■ Cooling water (seawater)
Make sure that water is coming out from the cooling water (seawater) outlet. When water is coming out intermittently or in small volume, check the following.
• Air in the cooling system.
• Faulty cooling seawater pump impeller.
• Clogged cooling seawater pipe and sea cock.

NOTICE
Never operate the engine if the seawater pump is not sucking up water. The seawater pump impeller will seize and become impossible to use again.

■ Coolant
Normally, the coolant temperature while running with load is 70 - 80 °C.
If the temperature exceeds 85 °C, check the following.
• Water leakage (temperature and coolant level warning devices may activate)
• Faulty water pump (coolant) or clogged coolant passage
• Faulty seawater or clogged seawater passage
• Insufficient coolant volume
• Heat exchanger restriction

■ Color of exhaust gas
Black smoke is a sign that the engine is overloaded. Such operation will shorten the life of intake and exhaust valves, piston rings, cylinder liners, turbocharger and particularly fuel injection nozzles. Avoid continuing operation if black smoke is being emitted.

■ Water leakage, oil leakage and other operational conditions
Always check whether there are water leakage, oil leakage, gas leaks, loose fasteners, and abnormal noise or temperature, low oil pressure and vibration or not.

■ Avoid operating the engine speed at critical speed
Avoid operating the engine speed that produce resonance (critical speed). Depending on the construction of hull, the engine and ship resonate at a certain rate of revolutions, and vibration may suddenly become great.
■ Alarm devices
When the buzzer sounds during engine running, at first check which alarm lamp is on, immediately set the engine speed to low speed and stop the engine, and then try to find the cause.

■ Long time operation at low speed
When the engine is operated for more than 4 hours at low speed, set the shift handle to the “NEUTRAL” position, and increase the engine speed without load for 1 minute at about 1800 min⁻¹ (rpm) to discharge residue from cylinders every 4 hours operation.

■ Operation of shift handle
Be sure to operate the throttle handle at a low speed (less than 1000 min⁻¹ (rpm)). If the marine gear is engaged or disengaged during high-speed or if it is used under half-clutch, the marine gear will damage or its life will be shortened.
Stopping

To stop the engine, set the shift handle to the “NEUTRAL” position, and perform the after no-load running at a low speed (600 - 700 min⁻¹ (rpm)) for about five minutes.

**NOTICE**

If the engine stops at hot condition due to over heating, the temperature of the coolant and various engine parts will rise abruptly, and the engine may be damaged.

1. To stop the engine remotely, press and hold the STOP button until the engine has stopped.
2. Set the starter key switch to the “OFF” position after stopping engine.
3. Remove the key from the starter switch, and turn off the battery switch.
4. Close the fuel cock.
5. Close the sea cock.
6. While the engine is still warm, wipe off dust and dirt from the engine.

**NOTICE**

- Storing the engine without draining may cause the seawater left inside the engine to freeze and damage to parts (heat exchanger, lubricating oil cooler, seawater pump) in the cooling water passage.
- Always use LLC in the coolant system under cold conditions.
Long-Term Storage

Storing engine for a long time

When the engine will not be used for a long term, perform the following. Consult your authorized YANMAR dealer or distributors.

- Choose a dry, dust-free location for storage.
- In cold climate, make sure that you fully drain coolant and seawater from both cooling systems.
- Loosen the V-belt.
- Disconnect the battery terminals from the engine, and store the battery fully charged. Charge the battery once a month to compensate for the battery’s self discharge.
- Remove any dirt, grime, or oil on the exterior and wipe it clean, and apply a coat of antirust agent or clean oil.
- Cover the exhaust pipe, intake, and electric devices with vinyl sheets to guard against moisture and dust.

Operating after long-term storage

Follow the steps below when restarting an engine which has been stored for 6 months or longer.

- Install full charged battery.
- Refer to [Running-in] before starting.
- Remove the rocker cover, and apply lubricating oil to the rocker arms.
- Check the cracks of the V belt and adjust the V belt tension.
- Check the damage of the impeller of the seawater pump.
- Perform cranking before operation to distribute lubricating oil to all of the parts.
**PERIODICAL MAINTENANCE**

- Periodical maintenance is an important factor in keeping the engine in the best condition. In accordance with operating hours given in the following maintenance schedule, perform periodic maintenance.
- When the parts are disassembled for checking and/or servicing, reassemble them properly.
- Please contact YANMAR dealer or distributor to inspect your engine or to replace any parts if you will.
- Consult your authorized YANMAR dealer or distributor about scheduling the engine overhaul.

### Periodic Maintenance Schedule

Fuel System

■ Fuel level check

<table>
<thead>
<tr>
<th>Service period</th>
<th>Daily</th>
</tr>
</thead>
</table>

Refill as required.

■ Fuel tank deposit draining

Open the drain cock on the tank to drain out sediment and water at the tank bottom.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Daily</th>
</tr>
</thead>
</table>

■ Fuel filter and fuel/water separator draining

Remove the drain plug to drain water from the fuel filter and fuel/water separator.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Every 50 hours</th>
</tr>
</thead>
</table>

■ Replace element of fuel filter and fuel/water separator

<table>
<thead>
<tr>
<th>Service period</th>
<th>Every 250 hours</th>
</tr>
</thead>
</table>

Replace element of fuel filter

Close the fuel tank drain cock.

Remove the cartridge filter with a filter wrench.

Apply a thin film of clean diesel fuel to the sealing surface of the new filter gasket.

Install a new filter and hand-tighten.

Use a filter wrench and tighten to 20 to 24 N·m.

Bleed the fuel system.

Replace element of fuel/water separator

Loosen the bolt in the center of the fuel filter and remove the filter case and element.

Replace the element with a new one.

When installing the new element and case, use new O-rings; tighten the center bolt securely.

NOTICE

• Before installing the element, clean the inside of the filter case.
• Do not forget to install the spring, retainer and O-rings.
• After replacing the element, be sure to bleed air from the fuel system.
Lubricating Oil System

■ Oil level checking
Check the oil level with the dipstick. Oil level must be maintained between the upper and lower level marks on the dipstick. Add the recommended oil up to the upper level mark, if necessary.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Daily (prior to operation)</th>
</tr>
</thead>
</table>

■ Replacement of oil filter
1. Remove the filter with the filter wrench. (Turn to the left.)
2. Before installing the filter, carefully wipe the installation side and apply lubricating oil to the packing surface.
3. Tighten the lubricating oil filter fully by hand, and then use a filter wrench to further tighten the filter. (Turn to the right.)
4. Check for oil leakage during operation.

<table>
<thead>
<tr>
<th>Service period</th>
<th>1st time</th>
<th>50 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>2nd time and after</td>
<td>Every 250 hours</td>
<td></td>
</tr>
</tbody>
</table>

■ Engine oil change
Wait for about one to two hours after stopping the engine, connect the end of the rotary pump rubber hose to the oil drain port, and drain oil. Fill the oil pan with recommended oil.

<table>
<thead>
<tr>
<th>Service period</th>
<th>1st time</th>
<th>50 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>2nd time and after</td>
<td>Every 250 hours</td>
<td></td>
</tr>
</tbody>
</table>

■ Marine gear oil change (YX-50S: Option)
Connect the end of the rotary pump rubber hose to the marine gear oil drain port, and drain oil. Fill the marine gear oil pan with recommended oil.

<table>
<thead>
<tr>
<th>Service period</th>
<th>1st time</th>
<th>50 hours</th>
</tr>

<tbody>
<tr>
<td>2nd time</td>
<td>250 hours</td>
<td></td>
</tr>
<tr>
<td>3rd time and after</td>
<td>Every year</td>
<td></td>
</tr>
</tbody>
</table>
Clean the marine gear oil strainer
1. Remove three bolts and washers.
2. Remove the cover (1), seal (3), spring and oil strainer (2).
3. Check the cover seal for damage. Replace if necessary.
4. Reinstall the oil strainer, spring, seal and cover.
5. Tighten the cover bolts.

<table>
<thead>
<tr>
<th>Service period</th>
<th>1st time</th>
<th>50 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>2nd time</td>
<td></td>
<td>250 hours</td>

<tr>
<td>3rd time and after</td>
<td></td>
<td>Every year</td>
</tr>
</tbody>
</table>

---

[Diagram of marine gear oil strainer components]
Cooling Water System (Seawater and Coolant)

Seawater system

- **Check cooling seawater discharging condition**
  From time to time during operation, check if water is coming out of the seawater outlet pipe. If water comes out intermittently or its volume is low during a high-speed run, stop the engine immediately, and check for the cause.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Daily (during operation)</th>
</tr>
</thead>
</table>

- **Checking and replacement of zinc anodes**
  Remove the zinc anode and scrape or remove with a wire brush the coating on the zins. If more than 50% of the zinc is corroded away, it should be replaced with new zinc.
  Zinc anodes are built into the following places:

<table>
<thead>
<tr>
<th>Q'ty</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heat exchanger</td>
</tr>
<tr>
<td>Air cooler</td>
</tr>
<tr>
<td>Engine lubricating oil cooler</td>
</tr>
<tr>
<td>Marine gear lubricating oil cooler (YX-50S: Option)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Service period</th>
<th>Every 250 hours</th>
</tr>
</thead>
</table>
■ Checking and replacement of seawater pump impeller

1. Remove the seawater pump cover and pull out the impeller. Check the impeller, wear plate and cover for wear or damage.
2. If the wear plate and cover are excessively worn, replace them with new ones.
3. When reassembling the pump, apply grease to the fitting area of the pump shaft and impeller, both end faces of the impeller and the tip of impeller blades.
4. When installing the impeller, position blades of the impeller as shown in the illustration at right.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Impeller replacement</th>
<th>Every year</th>
</tr>
</thead>
</table>

■ Seawater system cleaning

As the engine is used, coolers become foul, their cooling effect worsens, and coolant, intake air and lubricating oil temperature becomes abnormally high. Consequently, eliminate fouling of the seawater system, coolers in particular.

To clean the seawater system, consult your authorized YANMAR dealer or distributor.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Every year</th>
</tr>
</thead>
</table>
Coolant system

■ Coolant level checking
Check the coolant level before starting the engine in the cold condition.

1. Remove the filler cap from the coolant tank, and check coolant level. The level should be at the filler neck. If the level is low, add coolant up to the filler neck.

WARNING
Do not remove the filler cap when the engine is hot (above 60 °C). The coolant is under pressure and severe scalding could result.

2. On the coolant system with reservoir tank, check the coolant level in the reservoir tank. The level should be between the "FULL" and "LOW" level marks. Add coolant up to the "FULL" mark.

| Service period | Daily |

■ Water pump (coolant) leakage checking
Leakage of coolant may cause serious problems, such as seizure of the engine, as the volume of coolant decreases. If there is water leakage, consult your nearest authorized YANMAR dealer or distributor.

| Service period | Daily |

■ Coolant system cleaning
As the coolant system becomes dirty naturally, cooling efficiency worsens, and coolant temperature becomes abnormally high (above 85 °C) when the engine is operated for long time: clean the coolant system periodically. At the same time, clean the thermostats. As for periodic servicing, consult your nearest authorized YANMAR dealer or distributor.

| Service period | Every year |

■ Coolant change

| Service period | Every year |

WARNING
• Be sure to replace the coolant at the specified time.
• Be sure to follow the correct mixture ratio for Long Life Coolant (LLC). (Refer to [Coolant])
Checking and Servicing the Turbocharger

■ Wash the pre-filter
The pre-filter removes contaminations in the air and keeps the engine output in good condition.
1. Wash the pre-filter with a neutral detergent.
2. Wash the pre-filter with tap water, dry it sufficiently, and install.

■ Wash the blower
If the turbocharger blower is contaminated, the blower speed decreases and the boost pressure drops, causing the engine output to fall. Wash the blower, if the boost pressure drops (approx. 10% pressure drop compared with normal condition).
1. Prepare the blower wash fluid, freshwater, and oiler.
2. Remove the pre-filter from the intake silencer, and remove the water filler plug.
3. During the load operation, fill 50 cc of the blower wash fluid slowly from the water filler in approx. 10 seconds.
4. Approx. 3 minutes after filling the blower wash fluid, fill 50 cc of the freshwater from the water filler in approx. 10 seconds.
5. Continue the load operation for approx. 10 minutes to dry and check the output recovery.
6. Repeat the above washing operation for 3 to 4 times, if the performance is not recovered. Consult your authorized YANMAR dealer or distributor for repair.

<table>
<thead>
<tr>
<th>Interval</th>
<th>Pre-filter</th>
<th>When the boost pressure drops by 10% in comparison with the trial run. Or every 250 hours.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blower</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NOTICE**
Do not fill a large amount of the wash fluid and freshwater at once. It may result in a water hammer accident.
Remote Control Cables

■ Throttle handle
Operate the throttle handle from the position “L” to the position “H”, and check if the governor lever at the governor moves into the correct position. If there is disalignment between the throttle handle and the governor lever in their position, adjust the control cable by changing the clamping position of the bracket.

■ Shift handle (YX-50S: Option)
Check if the control lever at the marine gear moves when the shift handle is operated in the ahead, neutral and astern positions. If there is a disalignment between the lever and the handle, adjust the control cable by changing the clamping position of the bracket.

<table>
<thead>
<tr>
<th>Service period</th>
<th>1st time</th>
<th>50 hours</th>
</tr>
</thead>
<tbody>
<tr>

<td>Every 500 hours</td>
<td></td>
</tr>
</tbody>
</table>
Electrical Parts

■ Checking the alarm devices

<table>
<thead>
<tr>
<th>Service period</th>
<th>Daily</th>
</tr>
</thead>
</table>

■ Checking the battery fluid level
Battery electrolyte decreases as charging and discharging are repeated. Check normal electrolyte level is 10 - 20 mm above the pole plates. If level is low, add distilled water, refer to the illustration at right.

<table>
<thead>
<tr>
<th>Service period</th>
<th>Every 50 hours</th>
</tr>
</thead>
</table>

■ Alternator drive belt tension
If tension of the V-belt is too strong, wear and tear of the V-belt are more rapid. If too weak, V-belt slips and the alternator does not charge. Check if the belt deflection is 8 - 10 mm by pushing the center of the belt between the pulleys with a finger.
To adjust, adjusting bolts and move the alternator until the proper belt tension is obtained.

<table>
<thead>
<tr>
<th>Deflection</th>
<th>8 - 10 mm (Pressed by 98 N)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service period</td>
<td>Every 250 hours</td>
</tr>
</tbody>
</table>

Valve Clearance Adjustment
Consult your authorized YANMAR dealer or distributor about adjusting the valve clearance.

<table>
<thead>
<tr>
<th>Valve clearance</th>
<th>Intake</th>
<th>0.1 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Exhaust</td>
<td>0.5 mm</td>

<th>1st time</th>
<th>50 hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>2nd time</td>
<td>Every 6 months</td>
<td></td>
</tr>
</tbody>
</table>
The causes of abnormalities and troubles are diverse, and they break out from composite factors. Catching a change in running performance and referring to the record of maintenance and servicing date and the history of part replacement, locate the cause early and take the proper countermeasures.

- Starting failure
  - Flywheel not turned
  - Flywheel turned, but ignition not taken place
- Rotational speed dropped spontaneously
- Output of each cylinder not in uniformity
  (Dispersion of the exhaust temperature is large among cylinders)
- Bad color of exhaust gas
- Lubricating oil pressure dropped below the specified pressure
- Unusual sounds heard (knocking occurred) during operation
- Coolant temperature too high
- Exhaust temperatures of all the cylinders too high
- Engine stopped suddenly

**NOTICE**

- Although some failures can be solved by the user, others are not. For failures that require disassembly for repair and servicing or those that are not covered in this chapter, consult your authorized YANMAR dealer or distributor.
- If you judge that you can continue using the engine after inspection, cruise at a slow speed to return to port and, when landed, ask for repairs. If you cannot judge on your own, ask your authorized YANMAR dealer or distributor.
- Do not operate the engine if alarm devices are not working properly. Doing so may lead to a severe accident in case of a failure because you will not receive any alarm notifications.

### Lubricating oil pressure dropped below the specified pressure

<table>
<thead>
<tr>
<th>Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Looseness of lubricating oil pipe</td>
<td>Check and repair the lubricating oil pipe.</td>
</tr>
<tr>
<td>2. Clogging of lubricating oil filter</td>
<td>Replace the lubricating oil filter.</td>
</tr>
<tr>
<td>3. Excessive clearance of crankshaft bearing</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>4. Sticking of lubricating oil pressure regulating valve or loose adjusting bolt</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>5. Sticking of lubricating oil safety valve</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>6. Too high temperature of lubricating oil</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>7. Shortage of cooling water volume</td>
<td>Check the seawater pump.</td>
</tr>
<tr>
<td>8. Fouling of lubricating oil cooler</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>9. Excessive blow-by (gas leak) into the crankcase</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>10. Air sucked in lubricating oil pump (shortage of lubricating oil volume)</td>
<td>Replenish the lubricating oil.</td>
</tr>
</tbody>
</table>

### Unusual sounds heard (knocking occurred) during operation

<table>
<thead>
<tr>
<th>Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Inadequate intake/exhaust valve clearance</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>2. Inadequate fuel injection timing</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>3. Loosen some parts</td>
<td>Check and fix.</td>
</tr>
</tbody>
</table>
## Coolant temperature too high

<table>
<thead>
<tr>
<th>Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Shortage of cooling water volume</td>
<td>Check and clean the seawater strainer, sea cock and pipes.</td>
</tr>
<tr>
<td>• Clogging of seawater inlet passage</td>
<td>Check and repair the impeller.</td>
</tr>
<tr>
<td>• Failure of seawater pump impeller</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>• Failure of water pump (coolant)</td>
<td></td>
</tr>
<tr>
<td>2. Coolant level is low.</td>
<td>Refill with coolant.</td>
</tr>
<tr>
<td>3. Coolant is leaking.</td>
<td>Check and tighten the leaking part.</td>
</tr>
<tr>
<td>4. Sticking of coolant thermostatic valve</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
</tbody>
</table>

## Exhaust temperature of all the cylinders too high

<table>
<thead>
<tr>
<th>Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Charge air temperature too high</td>
<td>Check and repair the seawater pump.</td>
</tr>
<tr>
<td>• Shortage of charge air cooler cooling water volume</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
<tr>
<td>• Fouling of charge air cooler (cooling water side and air side)</td>
<td></td>
</tr>
<tr>
<td>• Engine room temperature too high</td>
<td>Check and service the engine room ventilation equipment.</td>
</tr>
<tr>
<td>2. Boost pressure too high</td>
<td>Check and service the engine room ventilation equipment.</td>
</tr>
<tr>
<td>3. Unsuitable properties of fuel oil</td>
<td>Use a high-quality fuel oil.</td>
</tr>
<tr>
<td>4. Overload</td>
<td>Reduce the load.</td>
</tr>
</tbody>
</table>

## Engine stopped suddenly

<table>
<thead>
<tr>
<th>Cause</th>
<th>Countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Fuel tank empty</td>
<td>Replenish the fuel oil.</td>
</tr>
<tr>
<td>2. Air mixed in fuel system</td>
<td>Bleed air from the fuel system.</td>
</tr>
<tr>
<td>3. Clogging of fuel filter</td>
<td>Replace the filter element.</td>
</tr>
<tr>
<td>4. Seizure of moving part (piston, main bearing, crank-pin bearing, timing gear, etc.)</td>
<td>Consult your authorized YANMAR dealer or distributor.</td>
</tr>
</tbody>
</table>
